Physical-World Operations for AI Companies

WHAT WE DO

[COMPANY_NAME] is a professional services firm that provides physical-world operations for AI companies. We deploy sensors, fly drones, collect field data, perform physical inspections, and execute real-world actions — all delivered as structured data into our clients' AI pipelines. We are the skilled, reliable humans that AI products need to interact with the physical world.

THE PROBLEM WE SOLVE

AI companies are building powerful products that analyze physical-world data or recommend physical-world actions. But they can't reach through the screen. They need someone to fly drones consistently, install sensors correctly, collect samples reliably, and perform inspections to standard — and deliver everything as structured data, not PDFs.

Current options fail them. **Gig platforms** are unreliable and deliver inconsistent data. **Traditional service firms** are slow, expensive, and don't understand AI workflows. **Hiring in-house** destroys the asset-light model. Our clients need a professional services partner built for how AI companies work.

WHO NEEDS THIS

AI Insight Companies

Sell analytics derived from physical-world data (drone imagery, sensor readings, field measurements). Need reliable data collection.

AI Action Companies

AI recommends physical-world changes (HVAC tuning, equipment calibration). Need qualified humans to execute.

Regulated AI Companies

Healthcare, environmental, food safety AI. Regulators require qualified humans to perform or verify physical measurements.

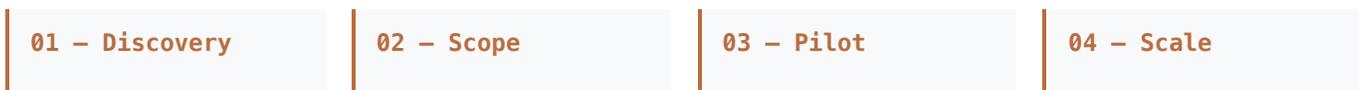

Autonomous Systems Companies

Vehicles, drones, robots not yet fully autonomous. Need human operators and safety supervisors during transition.

CAPABILITIES

- Drone inspection & aerial data
- IoT sensor deployment
- Field data collection for ML
- Physical QA & inspection
- Environmental sampling
- Autonomous systems support
- Recurring site inspections
- Sensor maintenance
- API/cloud data delivery

HOW AN ENGAGEMENT WORKS

Learn the AI product, data needs, and physical-world constraints

Define operations, equipment, cadence, quality standards, and deliverable formats

Limited execution to validate methodology and end-to-end data integration

Full operations with SLAs, QA, and structured data delivery into client pipeline

This is not a gig platform. [COMPANY_NAME] operates at a professional services level with contractual obligations, quality standards, SLAs, and structured data delivery. Clients are buying accountability and consistency, not task completion. Data is delivered via API, cloud storage, or direct pipeline integration — not in PDFs.
